

### What the experts say:

“This lengthy dunal system is the only location along the City of Stirling coastline where there remains a complete complex of foredune, swale and secondary dunal systems connected to inland and significant native remnant vegetation, extending from the coastal fore dunes to the woodland for approximately two kilometres inland.” Ref: Dr Judy Fisher Phd Ecologist

“Considering its location in the city this piece of bushland is in very good condition and contains a range of species characteristic of the Quindalup dune system. It provides a very good example of the type of plants found on the beach and the primary and secondary dunes. The vegetation in this reserve is stabilising the dunes, but any major disturbance would result in a much more mobile sand drift.” Ref: Judith Harvey, Wildflower Society of Western Australia.

## Trigg Beach is Bush Forever Area 308

Bush Forever is the State Government's designation of urban bushland that is representative of specific plant communities that will be lost forever in our urbanised environment - unless they are strictly protected. **It is a world class plan in Australia's only global biodiversity hotspot.** The research and analysis for this plan required an intensive effort by the science community over a period of years, and resulted in State Planning Policy 2.8.

Bush Forever Site 308 is renowned for its progression of dunes from the edge of the Indian Ocean to very tall dunes with Tuart, Banksia, Marri and Jarrah forest. There are different types of dunes, starting from the foredunes, through secondary and probable chaotic dunes, terminating in an unusual pair of nested parabolic dunes. (Ref: Friends of Trigg Bushland)

The Friends of Trigg Beach was formed in 2015 by a group of local residents, beach users and people concerned about protecting the natural environment at Trigg Beach.

If you have swum at Trigg Beach or enjoyed a walk along the coast you will have observed the contrast between it and Scarborough Beach, which has been developed as a tourist resort and is currently undergoing a massive redevelopment.

Pressure continues make Trigg Beach and Scarborough Beach one long developed coastline.

Join our group and help to protect the beautiful natural environment at Trigg Beach forever..
